MongoDB for TM Forum Open APIs

Solution Brief

Deliver TM Forum-compliant Open API microservices in days, rather than weeks or months. Build fast, pivot quickly, and scale far with MongoDB.

"MongoDB's document model has given CSPs the ability to be more agile and innovative at the same time. We're delighted to see MongoDB partnering with developers to deliver TM Forum-compliant microservices in days instead of weeks or months."

-George Glass, TM Forum Chief Technology Officer

Build Microservices Quickly

TM Forum's Open APIs are JSON-based, just like MongoDB's document data model. The data required to drive TM Forum Open APIs is persisted in its native JSON, allowing it to be served via the APIs without additional mapping.

Query, Transform, and Analyze Data in Place

MongoDB supports both API queries and business-specific rich analytical queries across the core database and in the cloud with Atlas search.

Scale Your OSS and BSS Products

MongoDB's native horizontal scaling capabilities allow for massive data throughput. Automatically scale with MongoDB Atlas, a cloud-hosted service on AWS, Azure, and Google Cloud.
